Automobile insurance

We will create small web application for automobile insurance. Application will have a dashboard where we will list all automobiles with details.

1. Create database migration for vehicle (id, brand, model, plate_number, insurance_date)
2. Use SoftDeletes in your model
3. Create database seeder and use this vehicle faker https://github.com/pelmered/fake-car
4. Create CRUD API routes and function for vehicle registration
5. Create dashboard and list all vehicles in table (use AJAX for API calls and fill table with data)
6. Create forms for add and edit. After save redirect to dashboard page
7. Add delete functionality in dashboard table. On click, soft delete selected vehicle.
8. Create command that will delete all softDeleted records and vehicle that insurance_date is already expired
9. Set command to be executed every 15 minutes
